New isolated, enriched, cell free and/or recombinant nucleic acid useful for e.g. altering cell proliferation characteristic such as to alter plant cell, organ or tissue size.

Claim 7; Fig 1; 77pp; English.

The present sequence represents a E2F-dimerisation partner (DP) protein. The protein acts as a plant E2F transcription factor. E2F and DP are two proteins that hetero-dimerise to form an active transcription factor that regulates G1 to S phase of the cell cycle, and later, the expression of genes required for S-phase progression. E2F and retinoblastoma protein also interact as a hetero-dimer in cells to suppress certain genes. This repression involves binding of the retinoblastoma protein to the E2F-DP dimer that is in turn bound to sites on DNA through the E2F DNA binding domain. DP proteins can be modulated to alter plant cell, organ or tissue shape, and particularly to alter cell proliferation characteristic such as to alter plant cell, organ or tissue size

The nucleic acid molecule and the encoded polypeptide, and methods are useful for modulating cell proliferation, senescence, differentiation, development, and stress response in plants, and for producing enhanced food crops. The present sequence represents a cell proliferation-related polypeptide. The present sequence is published separately from the main body of the

Arabidopsis thaliana.

The invention relates to a novel cell cycle protein (CCP) and the polympical conditates the activity of the polympication and which binds to the which modulates the activity of the polympical and which binds to the polympication and the activity of the polympication and the presence of CCP in a sample. A CCP antibody is useful for detecting the presence of CCP in a sample. A CCP antibody is useful for modulating the cell cycle or growth of a plant such as Arabidopsis thallana, rice, wheat, maize, tomato, alfalfa, oilseed trape, soybean, sumflower and canola. CCC maize, tomato, alfalfa, oilseed trape, soybean, sumflower and canola. CCC maize, tomato, alfalfa, oilseed trape, soybean, sumflower and canola. CCC conclete cated and polympication molecules are useful as modulating agents in plants. CCP is useful to treat abscrant activity. Compounds that bind to or modulate the activity of CCP protein or production of CCP protein forms which have decreased or abscrant activity. Compounds that bind to or modulate the activity of CCP polympicate are useful for modifying cell fate, plant development, plothemistry and/or physiology, the length of the CC polympication or enhancement of cell division, DNA replication, seed set, plant morphology, blothemistry and/or physiology, the length of the CC stimulation or enhancement of cell division, DNA replication, seed set, seed development, tuber, fruit, leaf formation, shoot and root initiation and/or development, tuber, fruit, leaf formation, about an droot continuate or resistance to stress cop, the polymclectide and the anti-CCP antibody are useful in agriculture to modulate the complete cop environmental conditions, including abjotic stress such as pathogen attack, to modulate e.g. enhance crop yields, and attendate cop pathogen attack, to modulate e.g. enhance cop pathogen attack, to modulate e.g. enhance cop is useful for expressing CCP percarge organs of plants quality traits, plant reproduction and seed development, endocadulatein is useful to screen for naturally cocur

New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant. N-PSDB; ADO62142

Claim 14; SEQ ID NO 610; 510pp; English

The present invention relates to novel plant transcription factor

proteins (1) and nucleotide sequences (II) (ADO61534-ADO6378). The

sequences can be used to produce transgenic plants, which overexpress

(II), where the transgenic plant has an allered trait as compared to a

non-transgenic plant or wild-type plant. The transgenic plant comprises

an altered trait selected from increased tolerance to callot, stress,
increased germination in cold, increased tolerance to cold,
increased germination in heat, increased tolerance to cold,
increased germination in heat, increased tolerance to disease, including

continuation in heat, increased tolerance to disease, including

thomsphate conditions, increased tolerance to disease, including

content of the planticularly Eryaphe, Rusarium and Botryfis,
increased sensitivity to ACC, altered sugar sensing, increased tolerance

contenessed sensitivity to ACC, altered sugar sensing, increased tolerance

contenessed sensitivity to ACC, altered sugar sensing, increased tolerance

contenessed sensitivity to ACC, altered sugar sensing, increased tolerance

contenessed sensitivity to ACC, altered sugar sensing, increased tolerance

contered carbon/nitrogen sensing, early flowering, attered

contered trichome structure, loss of flower determinacy, reduced

contered trichome structure, altered branning pattern,
altered stem morphology, altered ascular tissue structure, reduced

apical dominance, altered trichome density, altered trichome development,
altered call proliferation, altered coll expansion, altered shade

condensed sensescence, abnormal embry development, altered bange,
altered call proliferation, altered call expansion, altered shade

contered sensescence, abnormal embry development, altered phase change,
altered sensescence, abnormal embry development, altered proper and mass, light

cond increased biomass, large seedlings, darfed plants, altered seed

cond increased biomass, large seedlings, altered seed solarge,
altered seed coloration, altered seed singhes, alter seed, increased leaf wax, increased leaf fatty acids, altered seed oil content, altered seed protein content, altered seedprenyl content, altered leaf prenyl lipid content, increased anthocyanin levels, and decreased anthocyanin levels. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences.

                           Plant; transcription factor; transgenic plant; abiotic stress tolerance; sembits estress tolerance; cold tolerance; heat tolerance; low nitrogen tolerance; low phobbate tolerance; fungal disease; glyphosate resistance; flowering; fertility; seed development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel plant transcription factor proteins (1) and nucleotide sequences (11) (ADO61534-ADO63778). The sequences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a non-transgenic plant or wild-type plant. The transgenic plant comprises an altered trait selected from increased tolerance to ablotic stress, increased tolerance to condition in cold, increased tolerance to cold, increased tolerance to cold, increased tolerance to cold increased demandation in heat, increased tolerance to learn to tolerance to low nitrogen conditions, increased tolerance to low phosphate conditions, increased tolerance to low phosphate conditions, increased tolerance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.

altered stem morphology, altered vascular tissue structure, reduced
apical dominance, altered trichome density, altered trichome development,
altered trichome structure, altered root development, altered shade
avoidance, altered seed development, altered seed ripening, altered seed
avoidance, altered seed structure, altered cell differentiation,
content, lethality when overexpressed, altered necrosis pattered phase change,
altered senescence, abnormal embryo development, altered programmed cell
catch, lethality when overexpressed, altered necrosis patterns, increased
plant size, increased blomass, large seedlings, dwarfed plants, dark
green leaves, change in leaf shape, increased leaf size and mass, light
cgreen leaves, change in leaf shape, increased leaf size and mass, light
cgreen or gray leaves, glossy leaves, altered seed shape, large
altered seed coloration, altered seed size, altered seed shape, large
content, altered seed protein content, altered seed seed oil
content, altered seed protein content, altered seedprenyl content,
altered leaf prenyl lipid content, increased anthocyanin levels, and
decreased anthocyanin levels. Note: The sequence data for this patent did
cnot form part of the printed specification, but was obtained in
celectronic format directly from WIPO at
cleb wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ä

The present invention relates to an isolated nucleic acid molecule encoding a cell proliferation-related polypeptide. The nucleic acid molecule and the encoded polypeptide, and methods are useful for modulating cell proliferation, senescence, differentiation, development, and stress response in plants, and for producing enhanced food crops. The present sequence represents a cell proliferation-related polypeptide. The present sequence is published separately from the main body of the specification as EPO data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RKKEKAAAPRIT----GWGLREYSKIVCEKVEAKGRTTYNEVADEIYSELKSMAHIGQG 106

The invention relates to a novel cell cycle protein (CCF) and the polymucleotides encoding them. CCF is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the polypeptide and an anti-CCP antibody is useful for identifying a compound of CCF in a sample. A CCP modulator is useful for modulating the presence of CCP in a sample. A CCP modulator is useful for modulating the presence of CCP in a sample. A CCP modulator is useful for wheat, sumflower and canola. CCP maiole, all properties are useful as modulating agents in regulating call cycle progression in plants. CCP is useful to treat disorders characterised by insufficient or excessive production of CCP protein or production of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CCP polypeptide are useful as herbicides or plant growth regulators. The polypeptide are useful as herbicides or plant growth regulators. The polypeptide are useful as herbicides or plant growth regulators. The polypeptide are useful for modifying cell fate, plant development, stimulation or enhancement of cell division, DNA replication, seed set, S G2 and/or M phase of the cell cycle of a plant, initiation promotion, stimulation and/or development, under function, dwarfism in plants, initiation and/or development, tuber, fruit, leaf formation, shoot and root initiation and/or development, underly function, dwarfism in plants, continitiation heat, arought, salt stress, or bictic stress such as cold, nutrient protein levels or activity of a protein involved in the cell cycle due to protein levels or activity of a protein involved in the cell cycle due to pathogen attack, to modulate e.g. enhance crop yields, and attenuate plants or its parts. CCP is useful as an immunogen to generate antibodies. CCP protein is useful to screen for attually companies. CCP substrates. The polymorphic is useful for avpressing CCP modulate CCP activity. The present sequence represents a CCP protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ω

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                96
                                                                                                                                              invention relates to a novel cell cycle protein (CCP) and the mucleotides encoding them. CCP is useful for identifying a compound
New cell cycle protein and nucleic acid molecule encoding it useful for regulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 37 GNAVORKGAVDPDKDRKKEKAAAPRITGWGLREYSKIVCEKVEAKGRTTYNEVADEIYSE

                                                                                                                                                                                                                                                                                            The present invention relates to an isolated nucleic acid molecule encoding a cell proliferation-related polypeptide. The nucleic acid molecule and the encoded polypeptide, and methods are useful for modulating cell proliferation, senescence, differentiation, development, and stress response in plants, and for producing enhanced food crops. The present sequence represents a cell proliferation-related polypeptide. The present sequence is published separately from the main body of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polypeptide is a transcription factor that activates transcription of numerous genes involved in DNA replication, thus playing a role in the GI to S transition in the cell cycle. Do, also called DRTF (differentiation regulated transcription factor 1) has been shown to form specific multiprotein complexes with the retinoblastoms susceptibility protein, pl07, cyclins and cdk2. The DP polynucleotide was used to produce a transgenic plant. The DP nucleic acids and proteins are useful for increasing transformation efficiency in plants by increasing the number of dividing cells in the plant (dividing cells may be more receptive to transformation)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             111

```
The invention relates to a novel cell cycle protein (CCP) and the polymorlectides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the which modulates the activity of the polypeptide and which binds to the polypeptide and an anti-CCP antibody is useful for adulating the cell cycle or growth of a plant such as Arabidopsis thaliana, rice, wheat, maize, tomato, alfalfa, oilseed rape, soybean, sunflower and canola. CC cycle or growth of a plant such as Arabidopsis thaliana, rice, wheat, candle card and polypeptide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat disorders characterised by insufficient or excessive production of CCP protein forms which have decreased or personal activity. Compounds that bind to or modulate the activity of CCP protein forms which have decreased or polymeptide are useful as herbicides or plant growth regulators. The polymorlectide is useful for modifying cell fate, plant development, of plant morphology, biochemistry and/or physiology, the length of the G1, S2 and/or M phase of the cell cycle of a plant, initiation, promotion, grimulation or enhancement of cell division, DNA replication, seed set. Strimulation and/or development, tuber, fruit, leaf formation, shoot and root initiation and/or development, module function, dwarfing min plants.

Scaladon, heat, drevelopment, module function, dwarfing min plants, send the anti-CCP antibody are useful in agriculture to modulate the continuous or resistance to stress. CCP, the polymorlectide conditions, including ablocic stress such as cold, mutrient deprivation, heat, drought, salt stress, or biotic stress such as cold and the anti-CCP antibodies. CCP pathogen attack, to modulate e.g. enhance crop yields, and attenuate plant quality traits, plant reproduction and seed development, and ground in stress cold in the cell cycle due to generate antibodies. CCP protein is useful for expressing CCP protein, co 
                                                                                                                                                                                                                         Cell cycle protein; CCP; cell cycle regulation; herbicide;

The present invention relates to increasing the cell number of specific cell types, specific tissues or specific organs in a plant comprises modulating the expression and/or the activity in the specific cell types, specific tissues or specific organs of the plant E2F transcription factor. The E2F transcription factor or its homologue, derivative or fragment, is useful for prolonging the period of cell division in certain cells and tissues, for increasing the size of cotyledons, for enhancing cell proliferation after seed germination, for enhancing stress resistance of seedlings, for obtaining seedlings with enhanced vigor, for obtaining plants that have increased growth or number of organs, for obtaining plants having more cells in a particular tissue, for obtaining plants having an increased size of organs or having increased yield, for stimulating differentiated cells to re-enter the cell cycle, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modifying cell number, architecture and yield of plants comprises modulating the expression and/or the activity of members of the plant E2F

The present invention describes a method for modulating endoreduplication in a plant, or a part of the plant. The method comprises modifying the expression or activity of an E2F and DP gene or polypepitide. Also described: (1) a transgenic plant cell overexpressing an E2F or E2Fa gene, or an E2F and DP gene or an E2Fa and DP gene, where the E2F or E2Fa gene, or an E2F and DP gene is under the control of a tissue or cell-type specific promoter; (2) a transgenic plant, or a part of the plant, comprising the cells described above; (3) a progeny of the plant described above; and (4) a plant material obtained from the plant described above; The method is useful in modulating plant cell cycle proteins by modifying the expression or activity of an E2F and DP gene or polypeptide. The present sequence represents Arabidopsis thaliana DP, which is used in the exemplification of the present invention

Modulating endoreduplication in a plant, or a part of the plant, comprises modifying the expression or activity of an B2Fa and DPa gene or
